# PLSC 503 – Spring 2024 Bootstrapping and Missing Data

March 11, 2024

Bootstrapping...

The population is to the sample as the sample is to the bootstrap sample.

# Practical (Nonparametric) Bootstrapping

#### The General Idea:

- Draw one bootstrap sample of size N with replacement from the original data,
- Estimate the parameter(s)  $\tilde{\theta}_{k \times 1}$ ,
- Repeat steps 1 and 2 R times, to get  $\tilde{\theta}_r$ ,  $r \in \{1, 2, ...R\}$ , comprising elements  $\tilde{\theta}_{rk}$ ,
- Examine the empirical characteristics of the resulting distribution(s) of  $\tilde{\theta}_{rk}$ .

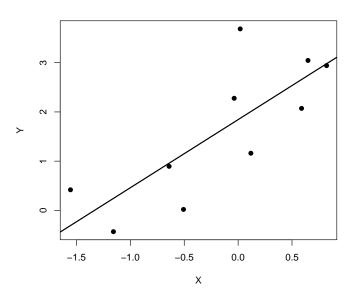

# Why Bootstrap?

- It's intuitive.
- It's simple.
- It's robust.

### Bootstrapping: "By Hand"

```
N<-10 # small sample!
reps<-1001
set.seed(1337)
X<-rnorm(N)
Y < -2 + 2 \times X + rnorm(N)
data<-data.frame(Y,X)
fitOLS<-lm(Y~X)
CI<-confint(fitOLS)
BO<-numeric(reps)
B1<-numeric(reps)
for (i in 1:reps) {
  temp<-data[sample(1:N,N,replace=TRUE),]
  temp.lm<-lm(Y~X,data=temp)
  B0[i] <- temp.lm $ coefficients[1]
 B1[i] <-temp.lm$coefficients[2]
BvHandB0<-median(B0)
BvHandB1<-median(B1)
ByHandCI.BO<-quantile(B0,probs=c(0.025,0.975)) # <-- 95% c.i.s
ByHandCI.B1<-quantile(B1,probs=c(0.025,0.975))
```

### Normal Residuals...

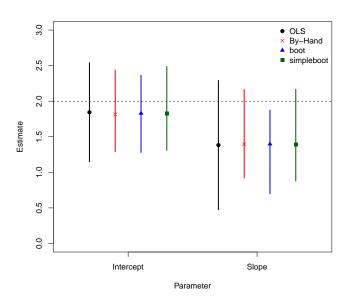

# Bootstrapping Via boot

### Bootstrapping Via simpleboot

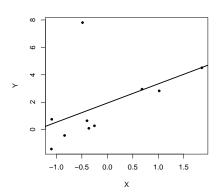

```
library(simpleboot)
Simple<-lm.boot(fitOLS,reps)
SimpleB0<-perc(Simple,.50)[1]
SimpleB1<-perc(Simple,.50)[2]
Simple.CIs<-perc(Simple,perc(0.025,0.975))</pre>
```

### **Bootstrapping Results**

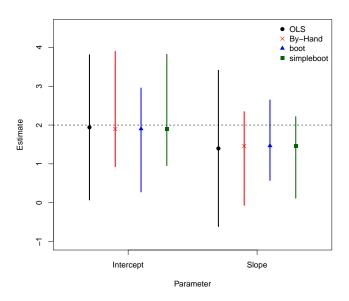

## Bootstrapping: Skewed Residuals

```
N<-10
reps<-1001
set.seed(1337)
X<-rnorm(N)
ustar<-rgamma(N,shape=0.2,scale=1)*6 # <- skewed u.s
Y<-2+2*X*(ustar-mean(ustar))
data<-data.frame(Y,X)
fitDLS<-lm(Y*X)
CI<-confinit(fitDLS)
```

### Skewed Residuals: Results

### When Should I Bootstrap?

### A few canonical applications:

- When N is small, and the estimator is consistent (but not unbiased / efficient)
- When the estimand(s) is/are complex
- When the distribution of the estimand(s) is unknown
- As a robustness check on your findings when data are complex

### **Bootstrapping Resources**

### R things:

- A simple introduction at StatMethods
- Bootstrap in R (at DataCamp)
- Packages: boot, bootstrap, simpleboot, car::Boot, broom (tidy), many more

### Other Resources:

- Efron's original (1979) paper
- Chernick and Labudde (2011) (a solid R-based bootstrapping book)
- A good little online intro, by James Scott
- Many other books, etc.

# **Missing Data**

# Missing Data, Part I: Why?

# Why are data missing?

- The observation itself does not exist
- Data don't exist for that observation
- Data exist, but are *impossible* to measure
- Data exist, but were not measured

# Missing Data, Part II: Flavors

Notation:

$$X_i \in \{W_i, Z_i\}$$

 $\mathbf{W}_i$  have some missing values,  $\mathbf{Z}_i$  are "complete"

$$R_{ik} = \begin{cases} 1 & \text{if } W_{ik} \text{ is missing,} \\ 0 & \text{otherwise.} \end{cases}$$

$$\pi_{ik} = \Pr(R_{ik} = 1)$$

# Missing Data, Part II: Rubin's Flavors

Missing completely at random ("MCAR"):

$$\textbf{R} \perp \{\textbf{Z}, \textbf{W}\}$$

Missing at random ("MAR"):

$$\textbf{R} \perp \textbf{W} | \textbf{Z}$$

Anything else is "informatively" (or "non-ignorably," or sometimes "MNAR") missing.

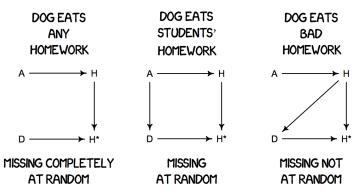

### MCAR vs. MAR vs. MNAR, Explained

H: Homework

H\*: Homework with missing values

A: Attribute of student

D: Dog (missingness mechanism)

(Source)

### Missing Data: Consequences

### In general:

#### MCAR:

- · Missing data are a fully random sample of all the data
- $\cdot \to \mathsf{Missingness}$  does not bias  $\hat{\theta}$ , but
- · There is some loss of information (and therefore efficiency)

#### MAR

- · Missing data are a nonrandom sample of all the data
- · Ignoring missingness can lead to bias in  $\hat{\theta}$ , but
- · Conditioning on the variable(s) that drive the missingness can eliminate the bias

### • Informative Missingness / MNAR

- · Missing data are a nonrandom sample of all the data
- · Ignoring missingness can lead to bias in  $\hat{\theta}$
- · In general, conditioning cannot eliminate the bias

## Example, Simulated

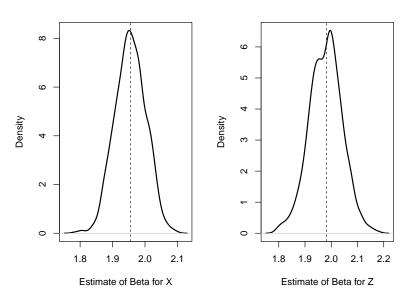

```
> set.seed(7222009)
> Npop <- 1000
> X<-runif(Npop,0,10) # NOTE: X, Z are correlated a bit...
> Z<-(0.3*X)+(0.7*runif(Npop,0,10))
> Y<-0+(2*X)+(2*Z)+rnorm(Npop,mean=0,sd=4)</pre>
> DF<-data.frame(X=X,Z=Z,Y=Y)
> fit.pop<-lm(Y~X+Z,DF)</pre>
> summary(fit.pop)
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
(Intercept) 0.4051
                        0.3260 1.24
                                          0.21
X
             1.9553 0.0466 41.97 <2e-16 ***
             1.9812
                       0.0617 32.09 <2e-16 ***
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' 1
Residual standard error: 3.98 on 997 degrees of freedom
```

Multiple R-squared: 0.823, Adjusted R-squared: 0.823 F-statistic: 2.32e+03 on 2 and 997 DF, p-value: <2e-16

### Simulated MCAR

```
> pmis < -0.50
> DF$Ymcar<-rbinom(Npop,1,pmis)</pre>
> DF$Ymcar<-ifelse(DF$Ymcar==1,NA,DF$Y)</pre>
>
> # Regression w/listwise deletion:
>
> fit.s<-lm(Ymcar~X+Z.DF) # <-- looks fine
> summary(fit.s)
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
(Intercept) 0.4442 0.4653 0.95 0.34
Х
             1.9661 0.0658 29.87 <2e-16 ***
             1.9763 0.0862 22.92 <2e-16 ***
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' 1
Residual standard error: 4 on 507 degrees of freedom
  (490 observations deleted due to missingness)
Multiple R-squared: 0.822, Adjusted R-squared: 0.821
F-statistic: 1.17e+03 on 2 and 507 DF, p-value: <2e-16
```

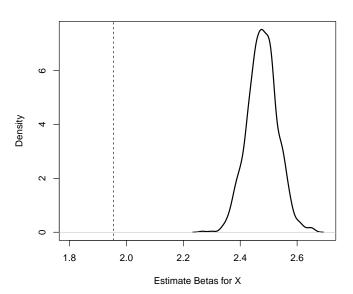

### Do That A Bunch Of Times...

### Simulated MAR Y

```
> set.seed(7222009)
> DF$Ymar<-rbinom(Npop,1,(DF$Z/10))</pre>
> DF$Ymar<-ifelse(DF$Ymar==1,NA,DF$Y)</pre>
>
> summary(lm(Ymar~X,DF))
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
                        0.3610 10.1 <2e-16 ***
(Intercept) 3.6600
X
             2.9923 0.0648 46.2 <2e-16 ***
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' 1
Residual standard error: 4.75 on 547 degrees of freedom
  (451 observations deleted due to missingness)
Multiple R-squared: 0.796, Adjusted R-squared: 0.795
F-statistic: 2.13e+03 on 1 and 547 DF, p-value: <2e-16
```

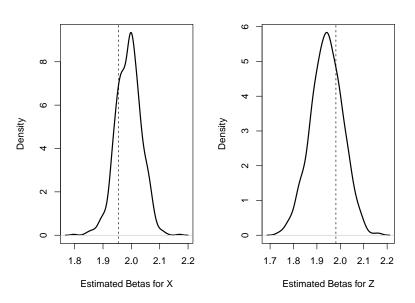

### Do That A Bunch Of Times...

### More MAR: Add Z...

```
> summary(lm(Ymar~X+Z,DF))
Call:
lm(formula = Ymar ~ X + Z, data = DF)
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
(Intercept) 0.2529
                       0.4367 0.58 0.56
X
             2.0200
                       0.0663 30.49 <2e-16 ***
             1.9499 0.0979 19.91 <2e-16 ***
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' 1
Residual standard error: 4.02 on 499 degrees of freedom
  (498 observations deleted due to missingness)
Multiple R-squared: 0.801, Adjusted R-squared: 0.8
F-statistic: 1e+03 on 2 and 499 DF, p-value: <2e-16
```

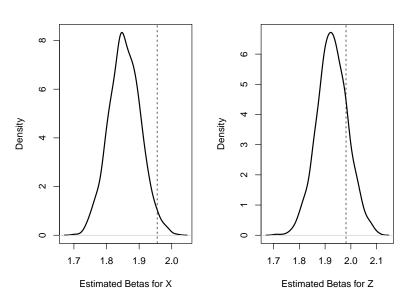

### Do That A Bunch Of Times...

### Informative Missingness / "MNAR"

```
> set.seed(7222009)
> DF$Yim<-rbinom(Npop,1,rescale(DF$Z-(4*DF$Y)))</pre>
> DF$Yim<-ifelse(DF$Yim==1,NA,DF$Y)
>
> summary(lm(Yim~X+Z,DF))
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
(Intercept) 2.0518 0.5463 3.76 0.00019 ***
X
             1.8420 0.0671 27.45 < 2e-16 ***
             1.9171 0.0859 22.32 < 2e-16 ***
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' ' 1
Residual standard error: 3.85 on 465 degrees of freedom
  (532 observations deleted due to missingness)
Multiple R-squared: 0.797, Adjusted R-squared: 0.796
F-statistic: 911 on 2 and 465 DF, p-value: <2e-16
```

### Do That A Bunch Of Times...

### A Real-Data Examples: 2020 ANES

Model is:

```
Biden Thermometer; = \beta_0 + \beta_1 R's Conservatism; +
= \beta_2 R Labor Union; + \beta_3 Female_i +
= \beta_4 Latino_i + \beta_5 Age / 10_i +
= \beta_6 Education_i + u_i
```

Data: ANES 2016-2020 Panel data, 2020 pre-election survey (N = 2839).

#### Three models:

- All data (N = 2291)
- 67% MCAR (via simulation) (N = 709)
- (MNAR) Data *only* on individuals who stated that they "strongly approved" of how then-President Trump was doing his job (N = 743)

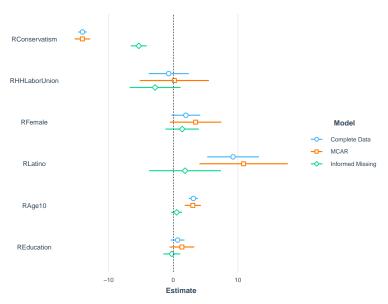

### Biden Thermometer Models

|                         | Dependent variable:       |                                     |                         |  |  |  |  |

# Biden Thermometer Models (II)

### How Much Missing Data Is A Problem?

"It is often supposed that there exists something like a critical missing rate up to which missing values are not too dangerous. The belief in such a global missing rate is rather stupid."

- Vach (1994, 113)

## What to Do About Missing Data?

- Listwise Deletion...
- Mean Substitution / Imputation
- "Nearest Neighbor" methods
- "Hot Deck" Imputation
- Multiple Imputation
- Model-Based Solutions

### MAR Data

For MAR data:

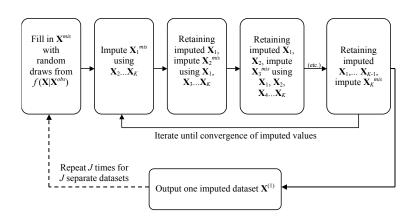

$$\mathbf{R} \perp \mathbf{W} | \mathbf{Z}$$

so W and Z factorize independently.

Sources of variation we need to consider:

- 1. Prediction
- 2. Predictive variation
- 3. Parameter variation / uncertainty

### MAR: Multiple Imputation

# Multiple Imputation (continued)

### Original Data X With Missing Data

| i | $X_1$            | $X_2$    | $X_3$           | $X_4$    |   | $X_K$    |
|---|------------------|----------|-----------------|----------|---|----------|
| 1 | X <sub>11</sub>  | $X_{21}$ | X <sub>31</sub> | $X_{41}$ |   | $X_{K1}$ |
| 2 | •                | $X_{22}$ | $X_{32}$        | •        |   | $X_{K2}$ |
| 3 | X <sub>13</sub>  | $X_{23}$ | •               | $X_{43}$ |   | $X_{K3}$ |

| • |                 | •               | •               | -        | • | •        |
| Ν | $X_{1N}$        | $X_{2N}$        | $X_{3N}$        | $X_{4N}$ |   | $X_{KN}$ |

Step Four: Use The Imputed  $X_1$  and  $X_2$ , Along With  $\{X_4,...X_K\}$  To Impute  $X_3^{\text{mis}}$ 

| i | $X_1$           | $X_2$           | <i>X</i> <sub>3</sub> | $X_4$           |   | $X_K$    |
|---|-----------------|-----------------|-----------------------|-----------------|---|----------|
| 1 | X <sub>11</sub> | X <sub>21</sub> | X <sub>31</sub>       | X <sub>41</sub> |   | $X_{K1}$ |
| 2 | $I_{12}^{(1)}$  | $X_{22}$        | X <sub>32</sub>       | $R_{42}$        |   | $X_{K2}$ |
| 3 | X <sub>13</sub> | $X_{23}$        | $I_{33}^{(1)}$        | $X_{43}$        |   | $X_{K3}$ |
| 4 | $X_{14}$        | $I_{24}^{(1)}$  | X <sub>34</sub>       | $X_{44}$        |   | $X_{K4}$ |
| 5 | $I_{15}^{(1)}$  | $X_{25}$        | X <sub>35</sub>       | $R_{45}$        |   | $R_{K5}$ |
| 6 | $X_{16}$        | $X_{26}$        | X <sub>36</sub>       | $X_{46}$        |   | $X_{K6}$ |
|   |                 |                 |                       |                 |   |          |
| : | :               | :               | :                     | :               | : | :        |
| • |                 | •               | •                     | •               | • | •        |
| Ν | $X_{1N}$        | $X_{2N}$        | X <sub>3N</sub>       | $X_{4N}$        |   | $X_{KN}$ |

(etc.)

Step K + 1: Use The Imputed  $X_1, X_2, ... X_{K-1}$  To Impute  $X_K^{mis}$ 

| i | $X_1$           | $X_2$          | $X_3$          | $X_4$          |   | $X_K$          |
|---|-----------------|----------------|----------------|----------------|---|----------------|
| 1 | X <sub>11</sub> | $X_{21}$       | $X_{31}$       | $X_{41}$       |   | $X_{K1}$       |
| 2 | $I_{12}^{(1)}$  | $X_{22}$       | $X_{32}$       | $I_{42}^{(1)}$ |   | $X_{K2}$       |
| 3 | X <sub>13</sub> | $X_{23}$       | $I_{33}^{(1)}$ | $X_{43}$       |   | $X_{K3}$       |
| 4 | X <sub>14</sub> | $I_{24}^{(1)}$ | $X_{34}$       | $X_{44}$       |   | $X_{K4}$       |
| 5 | $I_{15}^{(1)}$  | $X_{25}$       | $X_{35}$       | $I_{45}^{(1)}$ |   | $I_{K5}^{(1)}$ |
| 6 | $X_{16}$        | $X_{26}$       | $X_{36}$       | $X_{46}$       |   | $X_{K6}$       |
|   |                 |                |                |                |   |                |
| : | :               | :              | :              | :              | : | :              |
| • |                 | •              | •              | •              | • | •              |
| Ν | $X_{1N}$        | $X_{2N}$       | $X_{3N}$       | $X_{4N}$       |   | $X_{KN}$       |

#### **Iteration Two:**

Step One: Use The Imputed  $X_2, X_3, ... X_K$  To Impute  $X_1^{\text{mis}}$ 

| i | $X_1$           | $X_2$           | $X_3$           | $X_4$           |   | $X_K$          |
|---|-----------------|-----------------|-----------------|-----------------|---|----------------|
| 1 | $X_{11}$        | X <sub>21</sub> | X <sub>31</sub> | X <sub>41</sub> |   | $X_{K1}$       |
| 2 | $I_{12}^{(2)}$  | $X_{22}$        | $X_{32}$        | $I_{42}^{(1)}$  |   | $X_{K2}$       |
| 3 | X <sub>13</sub> | $X_{23}$        | $I_{33}^{(1)}$  | $X_{43}$        |   | $X_{K3}$       |
| 4 | X <sub>14</sub> | $I_{24}^{(1)}$  | $X_{34}$        | $X_{44}$        |   | $X_{K4}$       |
| 5 | $I_{15}^{(2)}$  | $X_{25}$        | $X_{35}$        | $I_{45}^{(1)}$  |   | $I_{K5}^{(1)}$ |
| 6 | $X_{16}$        | $X_{26}$        | $X_{36}$        | $X_{46}$        |   | $X_{K6}$       |
|   |                 |                 |                 |                 |   |                |
| : |                 | :               | •               | :               | : | :              |
| • | •               | •               | •               | •               | • | •              |
| Ν | $X_{1N}$        | $X_{2N}$        | $X_{3N}$        | $X_{4N}$        |   | $X_{KN}$       |

Step Two: Use The Imputed  $X_1, X_3, ... X_K$  To Impute  $X_2^{mis}$ 

| i | $X_1$            | $X_2$           | $X_3$           | $X_4$          |   | $X_K$          |
|---|------------------|-----------------|-----------------|----------------|---|----------------|
| 1 | X <sub>11</sub>  | $X_{21}$        | X <sub>31</sub> | $X_{41}$       |   | $X_{K1}$       |
| 2 | $I_{12}^{(2)}$   | $X_{22}$        | $X_{32}$        | $I_{42}^{(1)}$ |   | $X_{K2}$       |
| 3 | X <sub>13</sub>  | X <sub>23</sub> | $I_{33}^{(1)}$  | $X_{43}$       |   | $X_{K3}$       |
| 4 | $X_{14}$         | $I_{24}^{(2)}$  | $X_{34}$        | $X_{44}$       |   | $X_{K4}$       |
| 5 | $I_{15}^{(2)}$   | X <sub>25</sub> | X <sub>35</sub> | $I_{45}^{(1)}$ |   | $I_{K5}^{(1)}$ |
| 6 | $X_{16}$         | $X_{26}$        | $X_{36}$        | $X_{46}$       |   | $X_{K6}$       |
|   |                  |                 |                 |                |   |                |
| : | :                | :               | :               | :              | : | :              |
| • | · ·              | •               | •               | •              | • | •              |
| Ν | X <sub>1 N</sub> | $X_{2N}$        | $X_{3N}$        | $X_{4N}$       |   | $X_{KN}$       |

(etc.)

Step K: Use The Imputed  $X_1, X_2, ... X_{K-1}$  To Impute  $X_K^{mis}$ 

| i | $X_1$           | $X_2$          | $X_3$          | $X_4$           |   | $X_K$          |
|---|-----------------|----------------|----------------|-----------------|---|----------------|
| 1 | X <sub>11</sub> | $X_{21}$       | $X_{31}$       | X <sub>41</sub> |   | $X_{K1}$       |
| 2 | $I_{12}^{(2)}$  | $X_{22}$       | $X_{32}$       | $I_{42}^{(2)}$  |   | $X_{K2}$       |
| 3 | X <sub>13</sub> | $X_{23}$       | $I_{33}^{(2)}$ | $X_{43}$        |   | $X_{K3}$       |
| 4 | X <sub>14</sub> | $I_{24}^{(2)}$ | $X_{34}$       | $X_{44}$        |   | $X_{K4}$       |
| 5 | $I_{15}^{(2)}$  | $X_{25}$       | $X_{35}$       | $I_{45}^{(2)}$  |   | $I_{K5}^{(2)}$ |
| 6 | $X_{16}$        | $X_{26}$       | $X_{36}$       | $X_{46}$        |   | $X_{K6}$       |
|   |                 |                |                |                 |   |                |
| : | :               | :              | :              | :               | : | -              |
| • |                 | •              | •              | •               | • | -              |
| Ν | $X_{1N}$        | $X_{2N}$       | $X_{3N}$       | $X_{4N}$        |   | $X_{KN}$       |

## Multiple Imputation: Summary

### Basically:

- Repeat this process for  $J \approx 10$  iterations until convergence of the  $I_{ki}^{(j)}$ s.
- Output the resulting imputed data **X**<sup>(1)</sup>.
- Repeat this entire process M times to create M imputed datasets  $\{\mathbf{X}^{(1)}, \mathbf{X}^{(2)}, ... \mathbf{X}^{(M)}\}.$
- Rule of thumb: "Set M ≥ the percentage of cases in your data with missingness."
- Estimate models and conduct inference using multiple analysis and model averaging (see e.g. Schafer 1997, Ch. 4).

### MNAR Data

For MNAR data:

$$Pr(\mathbf{R}) = f(\mathbf{W}, \mathbf{Z})$$

i.e., missingness is nonignorable.

Common causes / situations:

- Omitted variables ( $\rightarrow$  can't condition on all elements of **Z**)
- Differential response due to unmeasured factors
- Truncation / censoring

### MNAR and Model-Based Solutions

For MNAR data, we must model the joint distribution Pr(X, R)...

### Approaches:

- Selection model: Pr(X, R) = Pr(X) Pr(R|X)
  - · E.g., Heckman (1976, 1979, etc.)
  - · Specifies a (usually, regression) model for  $Pr(\mathbf{R} \mid X)$

• Pattern-Mixture model: 
$$Pr(\mathbf{X}, \mathbf{R}) = Pr(\mathbf{X}|\mathbf{R}) Pr(\mathbf{X})$$
  
=  $Pr(\mathbf{X}|\mathbf{R} = 0) Pr(\mathbf{R} = 0) + Pr(\mathbf{X}|\mathbf{R} = 1) Pr(\mathbf{R} = 1)$ 

- · E.g., Glynn, Laird, and Rubin (1986)
- · Mixture-type model across "responders" and "non-responders"
- Others... [see, e.g., Little and Rubin (2002)]

## Multiple Imputation Example: ANES

Earlier, we created a data frame with  $\approx$ 75% MCAR missingness on the BidenThermometer variable:

```
> describe(MCAR.ANES)
                               sd median trimmed mad min max range skew kurtosis

                                           3.62 1.48 1.0 5 4.0 -0.26
                                                                         -0.67 0.02
```

We can multiply impute values for MCARBidenTherm using (e.g.) mice:

```
> mice.mcar<-mice(McAR.ANES,m=75,seed=7222009) # MICE object

iter imp variable
1 1 MCARBidenTherm
1 2 MCARBidenTherm
1 3 MCARBidenTherm
.
.
.
5 74 MCARBidenTherm
5 75 MCARBidenTherm</pre>
```

## Multiple Imputation Example: ANES (continued)

### Re-run the regression on the multiply-imputed data:

```
> fit.imputed.mcar<-with(mice.mcar.lm(MCARBidenTherm~RConservatism+
                        RHHLaborUnion+RFemale+RLatino+RAge10+
                        REducation))
> summary(pool(fit.imputed.mcar))
          term estimate std.error statistic
                                              df p.value
    (Intercept) 84.5889
                           5.1475
